

Your workflow as a Tier 2 Analyst

You no longer triage. Cases arrive already investigated, scoped and explained, and your job starts at the point where a human judgement is actually needed.

WHAT CHANGED FOR YOU

The Tier 1 queue has stopped being a human work list, so the console does not quietly hand it back to you. **You see only the alerts the AI decided a person must look at.** Everything else was dealt with without you, and the numbers on your dashboard tell you how much.

What lands with you

Two things, and nothing else.

WHAT	WHY IT REACHED YOU
Escalated alerts	Either a never-close rule fired, or the AI could not satisfy every condition needed to close it safely. Each arrives with a complete sixteen-section package.
Failed-safe alerts	The reasoning layer was unreachable, so the alert came to people rather than being guessed at. There is no AI verdict on these — you are starting from the raw alert.

You will not see alerts the AI closed on its own, or alerts it is holding. Those go to the AI Supervisor, whose job is checking the AI's work rather than investigating incidents.

Your steps on a case

- 1 Open the case from your list**
Sorted newest first by default. You can also sort by urgency, or by how unsure the AI was — that last one is often the most useful place to start.
- 2 Read what happened**
A plain-language summary first: what appears to have happened, to whom, when, and why it matters. Then the raw evidence the detection actually saw.
- 3 Check why it came to you**
If a never-close rule fired, it is listed with the reason it exists. These were decided in code before the AI was consulted, so they are facts about the alert, not opinions about it.
- 4 Read the two explanations**
The package gives you both the innocent and the malicious story, and names the single fact that would settle which is true — plus whether that fact could be obtained. This is the part that saves you the most time.

5

Look at what could not be checked

Every gap is written down, along with what it cost in confidence. If you disagree with the verdict, this is where you find out whether the AI was wrong or simply blind.

6

Investigate and resolve

From here it is your judgement and your tools. The case stays with you — no one else can move it once it has been escalated.

What is in the package

Sixteen mandatory sections, checked for completeness before it reaches you. This is what you open instead of a free-text handover note.

SECTIONS	WHAT THEY GIVE YOU
1–5 The alert itself	Incident and rule, times, what the rule claims in one sentence, the raw events, and every entity typed out.
6–9 The context	Asset owner and criticality, account type and privilege, every lookup including the clean ones, and related incidents with how they were closed.
10–13 The reasoning	A timeline in order, the innocent explanation, the malicious explanation, and the one question that would settle it.
14–16 What to do	Suggested next steps, containment that was considered and deliberately not done, and the confidence with everything that could not be checked.

Section 8 matters more than it looks: it records what came back *clean*. A lookup nobody wrote down is a lookup you would otherwise repeat.

What you can and cannot do

YOU CAN

- ✓ Open and read any case in the system, not only your own
- ✓ Read the full sixteen-section package
- ✓ See every never-close rule that fired, and why
- ✓ See what the AI could not check and what it cost
- ✓ Investigate and resolve the case in your own tools

YOU CANNOT

- ✗ Decide an alert the AI is holding — that is the supervisor
- ✗ Review or reopen a closure the AI made
- ✗ Approve a lesson the AI learns from
- ✗ Change autonomy, thresholds or kill switches

Worth knowing about the current build. In the console today your view is read-only: there are no buttons on a case for you. Overriding a verdict exists in the system but has no screen yet, so if you disagree with a verdict, raise it with the supervisor on duty rather than looking for a control that is not there.

Your dashboard

NUMBER	WHAT IT TELLS YOU
Cases on your plate	Escalations still open and waiting for you.
% arrived complete	How many packages had all sixteen sections. Should be 100. Anything less is a defect worth reporting.
Seconds to reach you at worst	The slowest case, end to end. Compare it with the 20–45 minutes a person needs to triage by hand.

Describes the Tier 2 role as built. Roles and permissions are enforced by the server, so a refused action is refused everywhere, not only on screen.
